WO 2004/022561 A1

## PYRAZOLOPYRIMIDINES AS CYCLIN-DEPENDENT KINASE INHIBITORS

Field of the Invention

The present invention relates to pyrazolo[1,5-a]pyrimidine compounds useful as protein kinase inhibitors (such as for example, the inhibitors of the cyclin-dependent kinases, mitogen-activated protein kinase (MAPK/ERK), glycogen synthase kinase 3(GSK3beta) and the like), pharmaceutical compositions containing the compounds, and methods of treatment using the compounds and compositions to treat diseases such as, for example, cancer, inflammation, arthritis, viral diseases, neurodegenerative diseases such as Alzheimer's disease, cardiovascular diseases, and fungal diseases. This application claims benefit of priority from U.S. provisional patent applications, Serial No. 60/408,027 filed September 4, 2002, and Serial No. 60/421,959 filed October 29, 2002.

Background of the Invention

Protein kinase inhibitors include kinases such as, for example, the inhibitors of the cyclin-dependent kinases (CDKs), mitogen activated protein kinase (MAPK/ERK), glycogen synthase kinase 3 (GSK3beta), and the like. Protein kinase inhibitors are described, for example, by M. Hale *et al* in WO02/22610 A1 and by Y. Mettley *et al* in *J. Med. Chem.*, (2003) 46 222-236. The cyclin-dependent kinases are serine/threonine protein kinases, which are the driving force behind the cell cycle and cell proliferation. Individual CDK's, such as, CDK1, CDK2, CDK3, CDK4, CDK5, CDK6 and CDK7, CDK8 and the like, perform distinct roles in cell cycle progression and can be classified as either G1, S, or G2M phase enzymes. Uncontrolled proliferation is a hallmark of cancer cells, and misregulation of CDK function occurs with high frequency in many important solid tumors. CDK2 and CDK4 are of particular interest because their activities are frequently misregulated in a wide variety of human cancers. CDK2 activity is required for progression through G1 to the S phase of the cell cycle, and CDK2 is one of the key components of the G1 checkpoint. Checkpoints serve to maintain the proper sequence of cell cycle events and allow the cell to

respond to insults or to proliferative signals, while the loss of proper checkpoint control in cancer cells contributes to tumorigenesis. The CDK2 pathway influences tumorigenesis at the level of tumor suppressor function (e.g. p52, RB, and p27) and oncogene activation (cyclin E). Many reports have demonstrated that both the coactivator, cyclin E, and the inhibitor, p27, of CDK2 are either over – or underexpressed, respectively, in breast, colon, nonsmall cell lung, gastric, prostate, bladder, non-Hodgkin's lymphoma, ovarian, and other cancers. Their altered expression has been shown to correlate with increased CDK2 activity levels and poor overall survival. This observation makes CDK2 and its regulatory pathways compelling targets for the development years, a number of adenosine 5'-triphosphate (ATP) competitive small organic molecules as well as peptides have been reported in the literature as CDK inhibitors for the potential treatment of cancers. U.S. 6,413,974, col. 1, line 23- col. 15, line 10 offers a good description of the various CDKs and their relationship to various types of cancer.

CDK inhibitors are known. For example, flavopiridol (Formula I) is a nonselective CDK inhibitor that is currently undergoing human clinical trials, A. M. Sanderowicz *et al*, *J. Clin. Oncol.* (1998) 16, 2986-2999.

Formula I

Other known inhibitors of the CDKs include, for example, olomoucine (J. Vesely *et al*, *Eur. J. Biochem.*, (1994) 224, 771-786) and roscovitine (I. Meijer *et al*, *Eur. J. Biochem.*, (1997) 243, 527-536). U.S. 6,107,305 describes certain pyrazolo[3,4-b] pyridine compounds as CDK inhibitors. An illustrative compound from the '305 patent has the Formula II:

Formula II

K. S. Kim *et al*, *J. Med. Chem.* 45 (2002) 3905-3927 and WO 02/10162 disclose certain aminothiazole compounds as CDK inhibitors.

5        Pyrazolopyrimidines are known. For Example, WO92/18504, WO02/50079, WO95/35298, WO02/40485, EP94304104.6, EP0628559 (equivalent to US Patents 5,602,136, 5,602,137 and 5,571,813), U.S. 6,383,790, *Chem. Pharm. Bull.*, (1999) 47 928, *J. Med. Chem.*, (1977) 20, 296, *J. Med. Chem.*, (1976) 19 517 and *Chem. Pharm. Bull.*, (1962) 10 620 disclose various  
10        pyrazolopyrimidines.

There is a need for new compounds, formulations, treatments and therapies to treat diseases and disorders associated with CDKs. It is, therefore, an object of this invention to provide compounds useful in the treatment or prevention or amelioration of such diseases and disorders.

25 The term "substituted" means that one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency under the existing circumstances is not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By "stable compound" or "stable  
30 structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The term "optionally substituted" means optional substitution with the specified groups, radicals or moieties.

The term "isolated" or "in isolated form" for a compound refers to the physical state of said compound after being isolated from a synthetic process or natural source or combination thereof. The term "purified" or "in purified form" for a compound refers to the physical state of said compound after being obtained from a purification process or processes described herein or well known to the skilled artisan, in sufficient purity to be characterizable by standard analytical techniques described herein or well known to the skilled artisan.

It should also be noted that any heteroatom with unsatisfied valences in the text, schemes, examples and Tables herein is assumed to have the hydrogen atom(s) to satisfy the valences.

When a functional group in a compound is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site when the compound is subjected to a reaction. Suitable protecting groups will be recognized by those with ordinary skill in the art as well as by reference to standard textbooks such as, for example, T. W. Greene *et al*, *Protective Groups in organic Synthesis* (1991), Wiley, New York.

When any variable (e.g., aryl, heterocycle,  $R^2$ , etc.) occurs more than one time in any constituent or in Formula III, its definition on each occurrence is independent of its definition at every other occurrence.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

Prodrugs and solvates of the compounds of the invention are also contemplated herein. The term "prodrug", as employed herein, denotes a compound that is a drug precursor which, upon administration to a subject, undergoes chemical conversion by metabolic or chemical processes to yield a compound of Formula III or a salt and/or solvate thereof. A discussion of prodrugs is provided in T. Higuchi and V. Stella, *Pro-drugs as Novel Delivery Systems* (1987) 14 of the A.C.S. Symposium Series, and in *Bioreversible*

*Carriers in Drug Design*, (1987) Edward B. Roche, ed., American Pharmaceutical Association and Pergamon Press, both of which are incorporated herein by reference thereto.

"Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid.

"Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanlates, methanlates, and the like.

"Hydrate" is a solvate wherein the solvent molecule is H<sub>2</sub>O.

"Effective amount" or "therapeutically effective amount" is meant to describe an amount of compound or a composition of the present invention effective in inhibiting the CDK(s) and thus producing the desired therapeutic, ameliorative, inhibitory or preventative effect.

The compounds of Formula III can form salts which are also within the scope of this invention. Reference to a compound of Formula III herein is understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)", as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of Formula III contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein.

Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful. Salts of the compounds of the Formula III may be formed, for example, by reacting a compound of Formula III with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates,

- 5 Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by S. Berge *et al*, *Journal of Pharmaceutical Sciences* (1977) 66(1) 1-19; P. Gould, *International J. of Pharmaceutics* (1986) 33 201-217; Anderson *et al*, *The Practice of Medicinal Chemistry* (1996), Academic Press, New York; and in *The Orange Book* (Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference thereto.

- Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as dicyclohexylamines, t-butyl amines, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups may be quarternized with agents such as lower alkyl halides (e.g. methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g. dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g. decyl, lauryl, and stearyl chlorides, bromides and iodides), aralkyl halides (e.g. benzyl and phenethyl bromides), and others.

- All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of Formula III, and salts, solvates and prodrugs thereof, may exist in their tautomeric form (for example, as an amide or imino ether). All such tautomeric forms are contemplated herein as part of the present invention.

- 30 All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts, solvates and prodrugs of the compounds as well as the salts and solvates of the prodrugs),

such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this invention, as are positional

5 isomers (such as, for example, 4-pyridyl and 3-pyridyl). Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention can have the S or R configuration as defined by the *IUPAC* 1974 Recommendations.

10 The use of the terms "salt", "solvate" "prodrug" and the like, is intended to equally apply to the salt, solvate and prodrug of enantiomers, stereoisomers, rotamers, tautomers, positional isomers, racemates or prodrugs of the inventive compounds.

The compounds according to the invention have pharmacological

15 properties; in particular, the compounds of Formula III can be inhibitors of protein kinases such as, for example, the inhibitors of the cyclin-dependent kinases, mitogen-activated protein kinase (MAPK/ERK), glycogen synthase kinase 3(GSK3beta) and the like. The cyclin dependent kinases (CDKs) include, for example, CDC2 (CDK1), CDK2, CDK4, CDK5, CDK6, CDK7 and CDK8. The

20 novel compounds of Formula III are expected to be useful in the therapy of proliferative diseases such as cancer, autoimmune diseases, viral diseases, fungal diseases, neurological/neurodegenerative disorders, arthritis, inflammation, anti-proliferative (e.g., ocular retinopathy), neuronal, alopecia and cardiovascular disease. Many of these diseases and disorders are listed in U.S.

20 rejection, endotoxic shock, and fungal infections.

Compounds of Formula III may also be useful in the treatment of Alzheimer's disease, as suggested by the recent finding that CDK5 is involved in the phosphorylation of tau protein (*J. Biochem*, (1995) 117, 741-749).

Compounds of Formula III may induce or inhibit apoptosis. The apoptotic  
25 response is aberrant in a variety of human diseases. Compounds of Formula III, as modulators of apoptosis, will be useful in the treatment of cancer (including but not limited to those types mentioned hereinabove), viral infections (including but not limited to herpesvirus, poxvirus, Epstein- Barr virus, Sindbis virus and adenovirus), prevention of AIDS development in HIV-infected individuals,  
30 autoimmune diseases (including but not limited to systemic lupus, erythematosus, autoimmune mediated glomerulonephritis, rheumatoid arthritis, psoriasis, inflammatory bowel disease, and autoimmune diabetes mellitus),

Compounds of Formula III, as inhibitors of the CDKs, can modulate the level of cellular RNA and DNA synthesis. These agents would therefore be useful in the treatment of viral infections (including but not limited to HIV, human papilloma virus, herpesvirus, poxvirus, Epstein-Barr virus, Sindbis virus and adenovirus).

Compounds of Formula III may also be useful in the chemoprevention of cancer. Chemoprevention is defined as inhibiting the development of invasive cancer by either blocking the initiating mutagenic event or by blocking the progression of pre-malignant cells that have already suffered an insult or inhibiting tumor relapse.

Compounds of Formula III may also be useful in inhibiting tumor angiogenesis and metastasis.

Compounds of Formula III may also act as inhibitors of other protein kinases, e.g., protein kinase C, her2, raf 1, MEK1, MAP kinase, EGF receptor, PDGF receptor, IGF receptor, PI3 kinase, wee1 kinase, Src, Abl and thus be effective in the treatment of diseases associated with other protein kinases.

Another aspect of this invention is a method of treating a mammal (e.g., human) having a disease or condition associated with the CDKs by administering a therapeutically effective amount of at least one compound of Formula III, or a pharmaceutically acceptable salt or solvate of said compound to the mammal.

A preferred dosage is about 0.001 to 500 mg/kg of body weight/day of the

compound of Formula III. An especially preferred dosage is about 0.01 to 25 mg/kg of body weight/day of a compound of Formula III, or a pharmaceutically acceptable salt or solvate of said compound.

If formulated as a fixed dose, such combination products employ the compounds of this invention within the dosage range described herein and the other pharmaceutically active agent or treatment within its dosage range. Compounds of Formula III may also be administered sequentially with known anticancer or cytotoxic agents when a combination formulation is inappropriate. The invention is not limited in the sequence of administration; compounds of Formula III may be administered either prior to or after administration of the 25 known anticancer or cytotoxic agent. For example, the cytotoxic activity of the cyclin-dependent kinase inhibitor flavopiridol is affected by the sequence of administration with anticancer agents. *Cancer Research*, (1997) 57, 3375. Such techniques are within the skills of persons skilled in the art as well as attending physicians.

## EXAMPLES

In general, the compounds described in this invention can be prepared through the general routes described below in Scheme 1. Treatment of the

10

### Scheme 1

starting nitrile with potassium t-butoxide and ethyl formate gives rise to the intermediate enol 2 which upon treatment with hydrazine gives the desired substituted 3-aminopyrazole. Condensation of compounds of type 3 with the

15 appropriately functionalized keto ester of type 5 gives rise to the pyridones 6 as shown in Scheme 3. The keto esters used in this general route are either commercially available or can be made as illustrated in Scheme 2.

### Scheme 2

20

The chlorides of type 9 can be prepared by treatment of the pyridones 8 with POCl<sub>3</sub>. When R<sup>2</sup> is equal to H, substitution in this position is possible on the compounds of type 9 by electrophilic halogenation, acylation, and various other electrophilic aromatic substitutions.

Introduction of the N7-amino functionality can be accomplished through

25 displacement of the chloride of compounds of type 9 by reaction with the appropriate amine as shown in Scheme 3.

50

Scheme 3

Condensation of compounds of type 7 with the appropriately functionalized malonate ester of type 11 gives rise to the pyridones 13 as shown in Scheme 4.

The chlorides of type 14 can be prepared by treatment of the pyridones 13 with POCl<sub>3</sub>. When R<sup>2</sup> is H, substitution in this position is possible on compounds of type 9 by electrophilic halogenation, acylation, and various other electrophilic aromatic substitutions.

Incorporation of the N7-amino functionality can be accomplished through regioselective displacement of the chloride of compounds of type 14. Incorporation of the N5-amino functionality by addition of an appropriate amine at higher temperature.

Scheme 4

Alternatively, condensations of the aminopyrazoles of type 7 with an appropriately functionalize keto ester as prepared in Scheme 5, leads to compounds of type 13 as shown in Scheme 4.

Scheme 5

The chlorides of type 14 can be prepared by treatment of the pyridones 13 with  $\text{POCl}_3$ . When  $\text{R}^2$  is equal to H, substitution in this position is possible on compounds of type 14 by electrophilic halogenation, acylation, and various other electrophilic aromatic substitutions.

10

Incorporation of the N7-amino functionality can be accomplished through displacement of the chloride of compounds of type 15.

### Preparative Examples:

#### PREPARATIVE EXAMPLE 1:

#### 15 Step A:

A procedure in German patent DE 19834047 A1, p 19 was followed. To a solution of  $\text{KOtBu}$  (6.17 g, 0.055 mol) in anhydrous THF (40 mL) was added, dropwise, a solution of cyclopropylacetonitrile (2.0 g, 0.025 mol) and ethyl formate (4.07 g, 0.055 mol) in anhydrous THF (4 mL). A precipitate formed immediately. This mixture was stirred for 12 hr. It was concentrated under vacuum and the residue stirred with  $\text{Et}_2\text{O}$  (50 mL). The resulting residue was decanted and washed with  $\text{Et}_2\text{O}$  (2 x 50 mL) and  $\text{Et}_2\text{O}$  removed from the residue under vacuum. The residue was dissolved in cold  $\text{H}_2\text{O}$  (20 mL) and pH adjusted to 4 – 5 with 12 N HCl. The mixture was extracted with  $\text{CH}_2\text{Cl}_2$  (2 x 50 mL). The

20

25

organic layers were combined, dried over  $\text{MgSO}_4$  and concentrated under vacuum to give the aldehyde as a tan liquid.

Step B:

- 5 The product from Preparative Example 1, Step A (2.12 g, 0.0195 mol),  $\text{NH}_2\text{NH}_2 \cdot \text{H}_2\text{O}$  (1.95 g, 0.039 mol) and 1.8 g (0.029 mole) of glacial  $\text{CH}_3\text{CO}_2\text{H}$  (1.8 g, 0.029 mol) were dissolved in EtOH (10 mL). It was refluxed for 6 hr and concentrated under vacuum. The residue was slurried in  $\text{CH}_2\text{Cl}_2$  (150 mL) and the pH adjusted to 9 with 1N NaOH. The organic layer was washed with brine,
- 10 dried over  $\text{MgSO}_4$  and concentrated under vacuum to give the product as a waxy orange solid.

PREPARATIVE EXAMPLES 2-4:

- By essentially the same procedure set forth in Preparative Example 1, only substituting the nitrile shown in Column 2 of Table 2, the compounds in
- 15 Column 3 of Table 2 were prepared:

PREPARATIVE EXAMPLE 4

2-Carbomethoxycyclopentanone (6.6 ml, 0.05 mol) in THF (15 ml) was added dropwise to a vigorously stirred suspension of NaH (60% in mineral oil, 4 g, 0.1 mol) in THF (100 ml) at 0 – 10 °C. When bubbling ceased, the reaction mixture was treated at the same temperature with ClCOOMe (7.8 ml, 0.1 mol) in THF (15 ml). The resulted off-white suspension was stirred for 30 minutes at room temperature and 30 minutes under reflux. The reaction was monitored by TLC for disappearance of starting material. The reaction mixture was quenched with water carefully and partitioned between ethyl acetate and saturated solution of ammonium chloride in a funnel. Shaken and separated, the organic layer was washed with brine and dried over anhydrous sodium sulfate. Solvents were removed, and the residue was purified by flash chromatography, eluted with 5% and then 10% ethyl acetate in hexane. 9.4 g colorless oil was obtained with 94% yield. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 3.90(s, 3H), 3.73(s, 3H), 2.65(m, 4H), 1.98(m, 2H).

PREPARATIVE EXAMPLE 5

To lithium diisopropylamide solution in THF (2.0 N, 0.04 mol) at –65 °C, was added dropwise 2,2-dicarbomethoxycyclopentanone (4 g, 0.02 mol) in THF (60 ml). The resulted reaction mixture was stirred at the same temperature before adding methyl chloroformate (1.54 ml, 0.02 mol). Reaction mixture stirred for an hour and poured into saturated ammonium chloride solution with some ice. This solution was extracted three times with ether, and the combined ethereal layers were dried over sodium sulfate. Solvents were removed in vacuo, and the residue was purified by flash chromatography, eluted with 30%

increased to 50% ethyl acetate in hexane. 2.3 g yellowish oil was obtained with 58% yield.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  3.77(s, 6H), 3.32(t, 1H), 3.60-3.10(m, 4H).

**PREPARATIVE EXAMPLE 6:**

- 5 The reactions were done as outlined in (K. O. Olsen, *J. Org. Chem.*, (1987) 52, 4531 – 4536). Thus, to a stirred solution of lithium diisopropylamide in THF at -65 to -70 C was added freshly distilled ethyl acetate, dropwise. The resulting solution was stirred for 30 min and the acid chloride was added as a solution in THF. The reaction mixture was stirred at -65 to -70° C for 30 min  
10 and then terminated by the addition of 1 N HCl solution. The resulting two-phased mixture was allowed to warm to ambient temperature. The resulting mixture was diluted with EtOAc (100 mL) the organic layer was collected. The aqueous layer was extracted with EtOAc (100 mL). The organic layers were combined, washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated *in vacuo* to give  
15 the crude  $\beta$ -keto esters, which were used in the subsequent condensations.

**PREPARATIVE EXAMPLES 7-19:**

By essentially the same procedure set forth in Preparative Example 6 only substituting the acid chlorides shown in Column 2 of Table 3, the  $\beta$ -keto esters shown in Column 3 of Table 3 were prepared:

5  $\text{BH}_3$ -THF solution (1 M, 24 mL, 5 eq) was added slowly to a stirring solution of 4-(2-pyridyl)-benzonitrile ( 0.85 g, 4.72 mmol ) in anhydrous THF ( 25 mL ) under Ar, and the resulting solution was refluxed for about 12 hr. The solution was cooled to 0°C using ice-water. Methanol (15 mL) was added drop-

 10 mL water and extracted with ether to remove any un-reacted material. The aqueous solution was neutralized with solid potassium carbonate to pH 10-11. The free amine, thus formed was extracted with ether, dried over potassium carbonate (0.45 g, 50%). **PREPARATIVE EXAMPLE 234:****5 Step A:**

A mixture 4-fluorobenzonitrile (3 g, 25 mmol) and imidazolyl sodium (2.48 g, 27.5 mmol) in DMF (50 mL) was stirred at 80°C under Ar for 12 h. Progress of reaction was monitored by TLC. The reaction mixture was concentrated *in vacuo* and the residue was diluted with 50 mL water and stirred. The aqueous mixture was extracted with EtOAc (2 x 50 mL). Combined EtOAc extracts was dried over anhydrous MgSO<sub>4</sub>, concentrated, and the 4-(1-imidazolyl)-benzonitrile was isolated by column chromatography (3.6 g, 78%). LCMS: MH<sup>+</sup> = 170; <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 8.0 (s, 1H), 7.5 (d, 2H), 7.4 (m, 3H), 7.3 (d, 1H)

**Step B:**

15 4-(1-imidazolyl)-benzonitrile (1g, 5.92 mmol) was dissolved in anhydrous THF (10 mL) and added drop-wise to a stirring solution of LAH –THF (1 M in THF, 18 mL) at room temperature. The reaction mixture was refluxed under Ar

for 2 h and the progress was monitored by TLC. The mixture was cooled to 0°C and quenched by drop-wise addition of a saturated Na<sub>2</sub>SO<sub>4</sub> – H<sub>2</sub>O solution. The mixture was stirred for 1 h and filtered to remove lithium salts. The filtrate was dried over anhydrous MgSO<sub>4</sub> and concentrated to obtain 4-(1-imidazolyl)-benzylamine (0.8 g, 80%). LCMS: MH<sup>+</sup> = 174.

PREPARATIVE EXAMPLE 235:

A mixture of 4-(5-oxazolyl)benzoic acid (1.0 g, 5.46 mmol) and Et<sub>3</sub>N (552 mg, 5.46 mmol) in 25 mL of THF was cooled to 0 °C and ClCOOi-Bu (745 mg, 5.46 mmol) was added dropwise. After the addition was over, the reaction mixture was stirred for additional 5 min and then aq NH<sub>4</sub>OH (0.63 mL of 28% solution, 10.46 mmol) was added. After overnight stirring, the solvent was evaporated, the residue was taken up in water and basified to pH 9. The precipitated solid was filtered, washed with water and dried over P<sub>2</sub>O<sub>5</sub> in a vacuum desiccator to provide 500 mg (48%) of the 4-(5-oxazolyl)-benzamide: <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) δ 8.50 (s, 1H), 8.20-7.80 (m, 5H).

PREPARATIVE EXAMPLE 236:

A suspension of 4-(5-oxazolyl)benzamide (500 mg, 2.657 mmol) in 10 mL of dry THF was cooled to 0 °C and 10 mL of 1 M BH<sub>3</sub>.THF (10.00 mmol) was added. The contents were refluxed overnight and the excess borane was destroyed by dropwise addition of methanol. The solvent was evaporated and the residue was treated with methanolic HCl to decompose the amine-borane

complex. After evaporation of the methanol, the residue was taken in water, basified to pH 10 and the product was extracted in to DCM. The DCM layer was dried ( $K_2CO_3$ ) and the solvent was removed to provide 150 mg (32%) of 4-(5-oxazolyl)benzylamine:  $^1H$  NMR ( $CDCl_3$ )  $\delta$  7.90 (s, 1H), 7.60 (d, 2H), 7.40 (d, 2H), 7.30 (s, 1H), 3.90 (s, 2H).

CH<sub>2</sub>Cl<sub>2</sub> (10 mL) was added to the mixture which was stirred vigorously for 30 min. The mixture was filtered thru a pad of Celite which was washed generously with CH<sub>2</sub>Cl<sub>2</sub> (3 x 5 mL). The resulting filtrate was concentrated under reduced pressure to afford 0.41 g (85%) of a yellow/orange solid. M+H = 142.

PREPARATIVE EXAMPLE 253**5** STEP A:

The mixture was stirred for 12 h at rt and 1N HCl (25 mL) was added. The layers were separated and the organic layer was washed sequentially with sat. aq.  $\text{NaHCO}_3$  (1 x 25 mL), and brine (1 x 25 mL). The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated under reduced pressure to afford 0.72 g (100%) of a yellow oil.  $M+H = 226$ . The crude material was taken onto Step B without further purification.

The resulting solution was stirred for 16 h at rt whereupon the mixture was quenched by addition of sat. aq.  $\text{NH}_4\text{Cl}$ . The mixture was concentrated to dryness and the resultant residue was stirred with EtOAc (100 mL) for 45 min and filtered. The filtrate was concentrated under reduced pressure to afford 0.68g (100%) of a yellow/orange oil.  $M+H = 226$ . The crude material was taken onto Step C without further purification.

**25** STEP C:

To a solution of the compound prepared in Preparative Example 253, Step B (0.68 g, 3.0 mmol) in MeOH (5 mL) was added a solution of KOH (0.68 g, 12.1 mmol) in MeOH (5 mL). The mixture was stirred at reflux for 12h and rt for 72h whereupon the mixture was concentrated to dryness. The crude residue

336				1. mp = 117-119 2. M+H = 382
337				1. mp = 171-175 2. M+H = 400

**EXAMPLE 338:**

227

**STEP A:**

5        Reaction of aniline (0.20 g, 0.69 mmol) with aldehyde (0.13 g, 0.83 mmol) under the reaction conditions described in Example 333 afforded 70 mg (23%) of thiomethyl derivative as a yellow solid.  $M+H = 428$ .

**STEP B:**

10        To a solution of thiomethyl derivative (60 mg, 0.14 mmol) from Example 338, Step A in dioxane (2 mL) was added  $Boc_2O$  (61 mg, 0.28 mmol) followed by DMAP (21 mg, 0.17 mmol). The mixture was stirred for 14h at rt and was concentrated under reduced pressure. The crude product was purified by preparative thin-layer chromatography (6 x 1000  $\mu M$  plates) eluting with hexanes/EtOAc (4:1) to afford 61 mg (83%) of the title compound as a yellow solid.  $M+H = 528$ .

**STEP C:**

15        To a solution of thiomethyl derivative from Example 338, Step B (41 mg, 0.078 mmol) in  $CH_2Cl_2$  (2 mL) was added MCPBA (33 mg, 0.19 mmol) in one portion. The resulting mixture was stirred for 3h at rt and the mixture was diluted

228

with  $\text{CH}_2\text{Cl}_2$  (5 mL) and sat. aq.  $\text{NaHCO}_3$  (2.5 mL). The layers were separated, the aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$  (2 x 5 mL), and the organic layers were combined. The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated under reduced pressure to afford 40 mg (92%) of the sulfone adduct as a light yellow solid.  $M+H = 560$ .

**STEP D:**

To a flask charged with sulfone from Example 338, Step C (75 mg, 0.13 mmol) and a stir bar was added morpholine (2 ml; 22 mmol). The mixture was heated at reflux for 12h, cooled to rt, and concentrated to dryness under high vacuum. The crude product was purified by preparative thin-layer chromatography (6 x 1000  $\mu\text{M}$  plates) eluting with  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (40:1) to afford 41 mg (68%) of the title compound as a yellow solid. mp 209-210  $^\circ\text{C}$ ;  $M+H = 466$ .

**EXAMPLE 339:**

The title compound was prepared according to the procedure outlined in Example 338 except using benzyl amine to afford 12 mg (70%) of a white solid. mp 194-196;  $M+H = 487$ .

**EXAMPLE 340:**

229

**STEP A:**

To a solution of 5-chloro adduct (0.15 g, 0.34 mmol) in dioxane/DIPEA (2.5mL/1.0mL) at rt was added cyclopentylamine (0.041  $\mu$ L, 0.41 mmol) dropwise. The resulting solution was stirred at reflux for 16h, cooled to rt, and concentrated under reduced pressure. The crude material was purified by preparative thin-layer chromatography (8 x 1000  $\mu$ M) eluting with  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (25:1) to afford 148 mg (89%) of a yellow oil.  $M+H = 489$ .

**STEP B: Removal of the t-butoxycarbonyl protecting group with TFA**

To a solution of the compound prepared in Example 340, Step A (135 mg, 0.28 mmol) in  $\text{CH}_2\text{Cl}_2$  (2 mL) at rt was added TFA (0.54 mL, 7.0 mmol) dropwise. The resulting solution was stirred for 18 h at rt and was concentrated under reduced pressure. The crude material was redissolved in  $\text{CH}_2\text{Cl}_2$  (5 mL) and the organic layer was sequentially washed with sat. aq.  $\text{NaHCO}_3$  (2 x 2 mL) and brine (1 x 2 mL). The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated under reduced pressure. The crude material was purified by preparative thin-layer chromatography (8 x 1000  $\mu$ M) eluting with  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (20:1) to afford 105 mg (97%) of white solid. mp 120-122  $^\circ\text{C}$ ;  $M+H = 389$ .

**EXAMPLE 341:****Step A:**

230

By essentially the same procedure set forth in Example 340 only substituting the appropriate amine, the above compound was prepared. MS:  $MH^+ = 431$ .

Step B: Removal to t-butoxycarbonyl protecting group with KOH.

To a mixture of the compound prepared in Example 341, Step A (0.14 g, 0.26 mmol) in EtOH : H<sub>2</sub>O (3 mL, 2 : 1) was added KOH (0.29 g, 20 eq.) in one portion. The resulting solution was stirred at reflux 14 hours, cooled to room temperature, and concentrated under reduced pressure. The residue was taken up in CH<sub>2</sub>Cl<sub>2</sub> (5 mL) and diluted with saturated NaHCO<sub>3</sub> (2 mL). The layers were separated and the aqueous layer extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 x 4 mL). The combined organics were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated under reduced pressure. The crude product was purified by preparative TLC (8 x 1000  $\mu$ M) eluting with 5% MeOH in CH<sub>2</sub>Cl<sub>2</sub> solution (0.066 g, 59% yield). MS:  $MH^+ = 432$ ; mp = 219-221°C.

**EXAMPLES 342-397:**

The combined individual filtrates from each tube were evaporated to dryness and the residues were each re-dissolved in anhydrous 1,4-dioxane (5mL) and placed in GeneVac reaction tubes. To each tube was added PS-isocyanate resin (594mg, 0.8742mmoles) and PS-trisamine resin (129mg, 0.4371mmoles) and the tubes were stirred at 25°C for 20h in the reaction block. 3-Bromo-7-chloro-5-(2-chlorophenyl)pyrazolo[1,5-a]pyrimidine (50mg, 0.146mmoles) (prepared as described in Preparative Example 129) was dissolved in anhydrous 1,4-dioxane (5mL) in a GeneVac Technologies carousel reaction tube. PS-diisopropyl ethylamine resin (161mg, 0.5828mmoles) was added to each tube. A freshly prepared solution of the appropriate amine  $R_1NH_2$  (0.219mmoles) in anhydrous 1,4-dioxane (0.3mL) was added to each tube, with the exception of Example 99-5 in which the amine was dissolved in 10% MeOH in 1,4-dioxane (0.3mL), and the tubes were sealed and heated at 70°C for 74h with magnetic stirring in the reaction block. Each tube was filtered and the resin was washed with anhydrous 1,4-dioxane and then dichloromethane. The combined individual filtrates from each tube were evaporated to dryness and the residues were each re-dissolved in anhydrous 1,4-dioxane (5mL) and placed in GeneVac reaction tubes. To each tube was added PS-isocyanate resin (594mg, 0.8742mmoles) and PS-trisamine resin (129mg, 0.4371mmoles) and the tubes were stirred at 25°C for 20h in the reaction block. The resins were filtered off and washed with anhydrous 1,4-dioxane and dichloromethane. The filtrates from each tube were evaporated to dryness and the residues were each chromatographed on a silica gel column using the column size and the eluant shown in Table 37, to give the title compounds.

#### EXAMPLE 475:

A mixture of the compound prepared in Example 129 (300 mg, 0.66 mmol), NaOH (5 g),  $CH_3OH-H_2O$  (100 mL, 90:10) was stirred at 25 C for about 15 h. Progress of hydrolysis was checked by TLC. Reaction mixture was concentrated to remove methanol. The concentrate was diluted with 50 mL water, and extracted with ether to remove any un-reacted ester. Aqueous solution, thus obtained, was neutralized with 3 N HCl to pH 4 to obtain free acid, filtered and washed repeatedly with water. The acid was dried under vacuum (270 mg, 93% ) and used without further purification.

#### Example 476-479:

By essentially the same procedure set forth in Example 475 only substituting the compounds in Column 2 of Table 39, the compounds in Column 3 of Table 39 were prepared.

The solvent was removed *in vacuo* and the residue was partitioned between water and EtOAc. The EtOAc layer was dried ( $\text{Na}_2\text{SO}_4$ ) and the solvent was evaporated. The resulting crude amidoxime was suspended in trimethyl orthoformate containing catalytic amount of PTS acid and refluxed overnight. The solvent was removed and the residue was taken up in EtOAc. The EtOAc layer was washed with aq  $\text{NaHCO}_3$  followed by water and brine. The solvent was evaporated and the residue was purified by chromatography (silica, hexane:EtOAc (1:1)) to provide

The solvent was removed *in vacuo* and the residue was dissolved in dry methanol. HCl gas was bubbled through the solution for 15 min and the reaction mixture allowed to stand at overnight at RT. The next day, the solvent was removed, the residue

**ASSAY:**

**BACULOVIRUS CONSTRUCTIONS:** Cyclins A and E were cloned into

10 pFASTBAC (Invitrogen) by PCR, with the addition of a GluTAG sequence (EYMPME) at the amino-terminal end to allow purification on anti-GluTAG affinity columns. The expressed proteins were approximately 46kDa (cyclin E) and 50kDa (cyclin A) in size. CDK2 was also cloned into pFASTBAC by PCR, with the addition of a haemagglutinin epitope tag at the carboxy-terminal end  
15 (YDVPDYAS). The expressed protein was approximately 34kDa in size.

**ENZYME PRODUCTION:** Recombinant baculoviruses expressing cyclins A, E and CDK2 were infected into SF9 cells at a multiplicity of infection (MOI) of 5, for 48 hrs. Cells were harvested by centrifugation at 1000 RPM for 10 minutes.

20 Cyclin-containing (E or A) pellets were combined with CDK2 containing cell pellets and lysed on ice for 30 minutes in five times the pellet volume of lysis buffer containing 50mM Tris pH 8.0, 0.5% NP40, 1mM DTT and protease/phosphatase inhibitors (Roche Diagnostics GmbH, Mannheim, Germany). Mixtures were stirred for 30-60 minutes to promote cyclin-CDK2  
25 complex formation. Mixed lysates were then spun down at 15000 RPM for 10

minutes and the supernatant retained. 5ml of anti-GluTAG beads (for one liter of SF9 cells) were then used to capture cyclin-CDK2 complexes. Bound beads were washed three times in lysis buffer. Proteins were competitively eluted with lysis buffer containing 100-200ug/mL of the GluTAG peptide. Eluate was

5 dialyzed overnight in 2 liters of kinase buffer containing 50mM Tris pH 8.0, 1mM DTT, 10mM MgCl<sub>2</sub>, 100uM sodium orthovanadate and 20% glycerol. Enzyme was stored in aliquots at -70°C.

IN VITRO KINASE ASSAY: CDK2 kinase assays (either cyclin A or E-

10 dependent) were performed in low protein binding 96-well plates (Corning Inc, Corning, New York). Enzyme was diluted to a final concentration of 50 ug/ml in kinase buffer containing 50mM Tris pH 8.0, 10mM MgCl<sub>2</sub>, 1mM DTT, and 0.1mM sodium orthovanadate. The substrate used in these reactions was a biotinylated peptide derived from Histone H1 (from Amersham, UK). The substrate was

15 thawed on ice and diluted to 2 uM in kinase buffer. Compounds were diluted in 10%DMSO to desirable concentrations. For each kinase reaction, 20 ul of the 50 ug/ml enzyme solution (1 ug of enzyme) and 20 ul of the 1 uM substrate solution were mixed, then combined with 10 ul of diluted compound in each well for testing. The kinase reaction was started by addition of 50 ul of 4 uM ATP and 1

20 uCi of <sup>33</sup>P-ATP (from Amersham, UK). The reaction was allowed to run for 1 hour at room temperature. The reaction was stopped by adding 200 ul of stop buffer containing 0.1% Triton X-100, 1mM ATP, 5mM EDTA, and 5 mg/ml streptavidine coated SPA beads (from Amersham, UK) for 15 minutes. The SPA beads were then captured onto a 96-well GF/B filter plate (Packard/Perkin Elmer

25 Life Sciences) using a Filtermate universal harvester (Packard/Perkin Elmer Life Sciences.). Non-specific signals were eliminated by washing the beads twice with 2M NaCl then twice with 2 M NaCl with 1% phosphoric acid. The radioactive signal was then measured using a TopCount 96 well liquid scintillation counter (from Packard/Perkin Elmer Life Sciences).

30

IC<sub>50</sub> DETERMINATION: Dose-response curves were plotted from inhibition data generated, each in duplicate, from 8 point serial dilutions of inhibitory

compounds. Concentration of compound was plotted against % kinase activity, calculated by CPM of treated samples divided by CPM of untreated samples.

To generate IC<sub>50</sub> values, the dose-response curves were then fitted to a standard sigmoidal curve and IC<sub>50</sub> values were derived by nonlinear regression analysis. The thus-obtained IC<sub>50</sub> values for the compounds of the invention are shown in **Table 87**. These kinase activities were generated by using cyclin A or cyclin E using the above-described assay.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-26,31-42

Present claims 1-26 and 31-42 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a relatively limited proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible.

In particular:

the vast number of values for most of the variables, in conjunction with their cascading meanings and especially the presence of open definitions such as "alkyl", "arylalkyl" or "heterocyclyl" and the like render the scope of the invention, for which protection is sought, ill-defined and obscure. Consequently, an exhaustive and complete search is precluded for practical and economical reasons. The search was based upon though not limited to examples and tables given in the description and to the subject-matter of claims 27-30 (cf. Arts. 6, 15 and Rule 33 PCT).

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

International application No.  
PCT/US 03/27555

**This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:**

- Box II** Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

**This International Searching Authority found multiple inventions in this international application, as follows:**

- ### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
